

EURACRYL ES DIA

Replacement and additional cutting inserts for the milling/polishing system with quickly changeable diamond cutting edges EURACRYL ES for processing glossy or transparent plastics as well as non-ferrous metals and composite materials in CNC machining centers and edge polishing machines.

12 standard cutting inserts with different cutting geometries are available. We also offer a large selection of special shapes on request.

All cutting inserts can be used universally. This means they can be used in all edge polishing machines and in all CNC machining centers that use the EURACRYL ES system.

All inserts have a standard height even after the resharpener service. They therefore do not need to be measured or adjusted again. The different inserts are color coded to make them easy to identify. The cutting geometries are optimized for the respective materials and functions. This allows you to achieve better results and extend the life of the tools.
