KUPER EURACRYL ABP310 CNC

Horizontal CNC controlled large format edge polishing machine

The most modern edge polishing machine in the world. There is no other way to describe this machine. The extraordinary control unit with the extensive material library EASY TOOL and special processing functions such as HIGH SPEED, MULTI STEP and COMBI MODE make it unbeatably flexible, versatile, efficient, cost-saving and ... and ...

The core is made of UHPC, a technical, high-precision concrete that absorb all vibrations and gives the machine a high level of rigidity. A multifunction table made of high-quality HPL with anti-streaking design, vacuum surface, anchor points for lateral reference guides and other accessories enables a variety of clamping options and increases the quality of the finished material surface. The front reference stop is over the complete length anchored every 300 mm in order to guarantee a constant milling depth over the entire length of the machine. if necessary, it can be readjusted precisely.

It is rounded off with extensive safety systems, remote maintenance, lighting, material pre-holding, adjustable holding pressure, aerodynamic suction hood, LOW NOISE spindle etc.

The almost infinite tool cutters combinations allow the creation of high-gloss or satin-finished surfaces as well as adhesive surfaces on all types of plastic and many material composites. With the EURACRYL ES quick tool change system, you can change the cutting edges in seconds without any adjustments.

EURACRYL V30

Tilting faceting and polishing machine

The EURACRYL V30 enables easy processing of transparent and glossy plastics. High-gloss or satin-finished bevels can be created quickly and efficiently with a continuously adjustable angle between 25° and 65°, as well as tension-free gluing surfaces.

The large selection of tools also allows the processing of mixed materials such as PMMA with aluminum or aluminum composites. Also cellulose-containing composites from the printing industry such as pictures in acrylic with an aluminum composite base.

Feed speed, tool rpm, bevel size, and angle are continuously adjustable. The set value is displayed on the respective digital display. The housing is partially made of noise-insulating HPL. The protective hood of the milling tool is aerodynamically designed to prevent chips from smearing the material surface while ensuring cooling of the milling area.

EURACRYL A26

Desktop edge polishing machine for plastics and mixed materials

With the EURACRYL A26, transparent and glossy plastics can be processed without any problems. High-gloss surfaces can be created as well as satined or tension-free surfaces for gluing.

The large selection of tools also allows the processing of mixed materials such as PMMA with aluminum or aluminum composites. Also cellulose-containing composites from the printing industry such as pictures in acrylic with an aluminum composite base.

The processing speed can be precisely adjusted to suit any material. The housing is made entirely of heat-dissipating aluminum. Along with the ventilation slots, this prevents overheating. The aerodynamically designed milling hood prevents chips from damaging the material surface and, at the same time, is designed to cool the milling area.

EURACRYL V20S

Chamfering and polishing machine with automatic feed

The EURACRYL V20S can easily process transparent and glossy plastics. High-gloss or satin-finished 45° chamfers and bevels, as well as tension-free bonding surfaces, can be created quickly and efficiently.

The large selection of tools also allows the processing of mixed materials such as PMMA with aluminum or aluminum composites. Also cellulose-containing composites from the printing industry such as pictures in acrylic with an aluminum composite base.

The processing speed is continuously adjustable to suit every material. The housing is made entirely of heat-dissipating aluminum. Together with the ventilation slots, overheating is prevented. The protective hood of the milling tool is aerodynamically designed to prevent chips from smearing the material surface and, at the same time, to cool the milling area.

EURACRYL V20

Desktop deburring and chamfer polishing machine

With the EURACRYL V20, transparent and glossy plastics can be processed without any problems. The edges can be deburred quickly and efficiently or, if necessary, high-gloss 45° chamfers and bevels can be created as well as satin-finished ones. Tension-free adhesive surfaces can also be created.

The large selection of tools also allows the processing of mixed materials such as PMMA with aluminum or aluminum composites. Also cellulose-containing composites from the printing industry such as pictures in acrylic with an aluminum composite base.

The processing speed is determined manually to suit each material. The housing is made entirely of heat-dissipating aluminum. Together with the ventilation slots, overheating is avoided. The protective hood of the milling cutter is aerodynamically designed so that the chips do not smear the material surface and at the same time designed in such a way that the milling area is also cooled.

EURACRYL ES / ST

Diamant tools for all edge polishing machines in the world.
More than 2400 tool options for following manufacturers:

EURACRYL

BERMAQ

WORLDMAQ

WOLF MACRYL

AF ACRYL

REICHEL BUBEBHEIMER

EFC

SHANNON

CODEMA

MALCOMPLAST

CR CLARKE

MINTECH
